Schwerin, 1st of April 2020

Activity of the disinfectant VIROL – OXY of the company Watch Water GmbH against Corona virus, especially against the new Corona virus strain (SARS-CoV-2)

EXPERT OPINION

Corona viruses belong to the enveloped viruses. They usually cause mild respiratory or intestinal infections in humans. The newly emerged strain Sars-CoV-2 makes an exception in this point because it can also cause a life-threatening respiratory infection.

The product **VIROL – OXY** of the company **Watch Water GmbH** was tested according to EN 14476 (European Phase 2, Step 1, Suspension test; test report PB2020-0658, SN 29308, dated 2020-03-31) for a limited virucidal activity and proved to show activity of $\geq 4lg$ against the Bovine Corona viruses:

**0.5% (m/v) application concentration / 10min contact time /
room temperature**

Therefore one can assume an activity against Corona virus including the new Corona virus strain (SARS-CoV-2) under the same conditions.
